

#### 4.2.3.2.3 RMN em 2D

Na figura 51, apresentada no subitem anterior, além do sinal em 80 ppm destaca-se a duplicação de dois sinais próximos ao sinal de C6. A interpretação do espectro de RMN de  $^1\text{H}$  do produto **9cA** indica pelas integrais e desdobramentos, que o simpleto menor vizinho ao simpleto de H2, trata-se do sinal de H2'', assim como o duplo duplete menor vizinho ao sinal de H6 trata-se de H6''.

A relação entre esses sinais menores com os sinais de seus respectivos carbonos foi determinada no espectro de HMQC da substância **9cA** (Figura 52). Definindo que o carbono em 80 ppm é o C2'', pertencente ao atropoisômero minoritário, já o sinal de C6'' (53,4 ppm) aparece vizinho ao de C6 (54,6 ppm).

O outro sinal duplicado próximo a C6, segundo o espectro de HMQC, pertence a C5'', o qual ressona à 52,0 ppm. O sinal de C5'' é bastante desblindado em relação a C5 que ressona em 32,3 ppm um deslocamento químico típico para esse carbono.

**Figura 52:** Espectro de HMQC da substância **9cA** expandido na região dos sinais de H2, H2'', H5, H5'', H6, H6'', C2, C2'', C5, C5'', C6 e C6'' (400 MHz para  $^1\text{H}$  e 100 MHz para  $^{13}\text{C}$ ,  $\text{CDCl}_3$ , 25 °C).

A substância **9cB** também foi submetida a caracterização por HMQC e este outro diastereoisômero e seu atropoisômero mantiveram os mesmos padrões de sinais (Figura 53).

**Figura 53:** Espectro de HMQC da substância **9cB** expandido na região dos sinais de H2, H2", H5, H5", H6, H6", C2, C2", C5, C5", C6 e C6" (400 MHz para  $^1\text{H}$  e 100 MHz para  $^{13}\text{C}$ ,  $\text{CDCl}_3$ , 25 °C).

Outra avaliação da estrutura química por RMN em 2D foi realizada por HMBC. Nesse estudo, algumas definições de sinais foram possíveis para o exemplo discutido, todavia é muito complicado estendê-las para todas as substâncias em função da complexidade de seus espectros. A discussão do HMBC é feita, somente, para o diastereoisômero **A**, afinal este foi isolado em todos os exemplos.

A figura 54 é uma expansão do espectro de HMBC da substância **9cA**, que mostra todos acoplamentos H6. Verifica-se no espectro que H6 faz acoplamento, somente, com um carbono alifático da porção THNA, ou seja tal carbono é C15 (29,1 ppm). H6 também acopla com C2 e com um único carbono aromático quaternário, definido como C12 (132,9 ppm). Nesse experimento foi detectado apenas um acoplamento três ligações distantes. Com a detecção desse acoplamento, esperava-se acoplamentos de H6 com outros Car e Calif, entretanto não ocorreram.

**Figura 54:** Espectro de HMBC da substância **9cA** expandido nos acoplamentos de H6 (400 MHz para  $^1\text{H}$  e 100 MHz para  $^{13}\text{C}$ ,  $\text{CDCl}_3$ , 25  $^\circ\text{C}$ ).

Analisando a região dos acoplamentos de H2 (Figura 55) nota-se o seu acoplamento com o C5, com o carbono carbonílico C4 e com dois carbonos aromáticos equivalentes que ressonam em 126,6 ppm, caracterizando estes carbonos com sendo C17 e C17A. Dessa forma, o sinal também referente a dois Car em 124,3 ppm é de C18 e C18A.

**Figura 55:** Espectro de HMBC da substância **9cA** expandido nos acoplamentos de H2 (400 MHz para  $^1\text{H}$  e 100 MHz para  $^{13}\text{C}$ ,  $\text{CDCl}_3$ , 25  $^\circ\text{C}$ ).

Ao relacionar os sinais dos carbonos 17, 17A, 18 e 18A com seus hidrogênios no HMQC (Anexo VI), verifica-se que há uma inversão na relação dos sinais, pois H18 e H18A são sinais mais desblindados que H17 e H17A.

Com o estudo dos espectros de RMN em 1D e 2D pode-se definir os principais sinais característicos que comprovam a formação dos produtos **8** e **9**. Ainda, foi possível observar o comportamento dos sinais que definem um e outro diastereoisômero **A** e **B**, estando tal definição relacionada aos sinais de H6 e H2. Novamente, foi verificada a ocorrência do fenômeno de atropoisomerismo em alguns exemplos.

As tabelas 12 e 13 apresentam os sinais de  $^1\text{H}$  e  $^{13}\text{C}$ , respectivamente, característicos da formação das 2-aryl-1,3-tiazolidin-4-onas das series **8** e **9**. No anexo V encontram-se os demais dados espectrais e no VI todos os espectros completos dessas moléculas.

**Tabela 12:** Dados espectrais (CDCl<sub>3</sub>, 25 °C, δ ppm, multiplicidade e J<sub>H-H</sub> Hz) obtidos por RMN de <sup>1</sup>H dos principais H que caracterizam a formação das 2-aril-1,3-tiazolidin-4-onas **8** e **9**.

#### 4.2.3.3 Raios X

O estudo cristalográfico foi realizado com a intenção de definir a estereoquímica do centro de simetria C2 e então caracterizar os quatro diastereoisômeros possíveis. Entretanto, após os estudos realizados em parceria com o grupo NUQUIMHE-UFSM, a definição da estereoquímica não pode ser concretizada, uma vez que o equipamento utilizado identifica apenas os átomos não hidrogenóides, sendo os átomos de hidrogênio da estrutura calculados, a partir de uma probabilidade estatística feita pelo software para o refinamento dos dados adquiridos. Todavia, se o centro de simetria não possuisse átomos de hidrogênio a quiralidade seria resolvida por esse método, como inicialmente pretendido.

A figura 56 apresenta os ORTEPs dos produtos **8i**, **8n**, **9i** e **9n**, os quais formaram monocristais avaliáveis por esta técnica. Essas estruturas são todas dos diastereoisômeros A.

Figura 56: ORTEP das tiazolidinonas **8i**, **8n**, **9i** e **9n**.

#### 4.2.4 Mecanismo de reação

O mecanismo de reação para a formação dos produtos **8** e **9** difere do proposto no item 4.1.4.1, somente, na etapa de formação da imina **79**. Na síntese dos exemplos **8** e **9** a imina é formada sem haver a protonação da carbonila (Esquema 31).

**Esquema 31:** Proposta de mecanismo de reação para a formação da imina **79** nas séries **8** e **9**.

#### 4.2.5 Conclusões sobre a segunda parte de discussões dessa tese: ITEM 4.2 derivados das *R* e *S*-1,2,3,4-tetrahidronaftilaminas

A síntese das substâncias a partir das aminas de estereoquímica definida **6** e **7** foi realizada através de uma reação multicomponente one-pot, em um tempo razoavelmente curto (6 h). A primeira análise de confirmação de formação dos produtos desejados (CG-EM) indicou uma maior formação de um dos diastereoisômeros. Tal resultado influenciou na possibilidade de obter quantidades significativas de ambos os diastereoisômeros **A** e **B**.

O método de purificação e separação dos diastereoisômeros foi escolhido com base na literatura. Através da cromatografia em coluna foram isolados os isômeros **B**, somente, dos produtos derivados do 4-nitrobenzaldeído (**8c** e **9c**). Com exceção de **8l** e **9l** dos demais produtos foi isolado unicamente o diastereoisômero **A**. Alguns exemplos de tiazolidinonas **8** e **9** não foram discutidos no trabalho em virtude de não ter acontecido uma separação eficiente entre **A** e **B**.

Na avaliação das substâncias das séries **8** e **9**, por CG-EM foram encontrados todos os íons moleculares e fragmentos que confirmam suas formações. Por RMN de  $^1\text{H}$  e  $^{13}\text{C}$ , todos os sinais característicos da formação do heterociclo tiazolidinona foram observados. Além disso, esta caracterização possibilitou definir o padrão de

sinais que diferenciam os diastereoisômeros **A** e **B**. Ainda em alguns exemplos foi verificada a ocorrência do fenômeno de atropoisomerismo, assim como nas 2-aril-tiazolidin-4-onas **4** derivadas da amina aromática 5,6,7,8-THNA **3**, relacionando este fenômeno a estrutura das aminas de partida.

Pela técnica inicialmente pretendida (difração de raios X) não se pode atingir um dos objetivos do trabalho: a definição da estereoquímica. Outros estudos estruturais precisam ser realizados a fim de determinar a estereoquímica do centro de simetria C2, bem como estudos semelhantes aos realizados para os produtos **4** devem ser desenvolvidos visando elucidar a estrutura do atropoisômero que tem seus sinais de RMN bem diferentes (C2" e C5") do esperado para as tiazolidinonas.

## 6 Considerações Finais

Neste trabalho foram apresentados e discutidos os resultados encontrados nos estudos da síntese e caracterização de 2-aril-1,3-tiazolidin-4-onas **4**, **8** e **9** e 5-aril-1,4-benzotiazepin-2-onas **5**. Foram sintetizados e caracterizados 21 exemplos do heterociclo de cinco membros e 5 exemplos do heterociclo de sete membros. Todos os produtos são inéditos até a data deste relatório.

No estudo, primeiramente, foi observada a influência do grupo substituinte do benzaldeído para o mecanismo de reação com a amina **3**, pois, de modo geral, os benzaldeídos substituídos com GRE promoveram a reação de formação das tiazolidinonas **4** e os substituídos por GDE conduziram a formação das benzotiazepinonas **5**, as explicações para tal não são discutidas na literatura, sendo necessário dedicar-se a esse estudo.

Ainda foi ratificada a influência da nucleofilidade das aminas de partida nos tempos das reações de formação das tiazolidinonas, pois os produtos oriundos da THNA amina aromática **3** foram obtidos em um tempo de reação 14 horas superior ao tempo dos produtos oriundos das aminas alifáticas **6** e **7**.

Os rendimentos dos produtos foram afetados por diversos fatores, por exemplo, a aromaticidade da amina **3** levou a formação de intermediários imina **71** pouco reativos prejudicando seu consumo total, reduzindo a conversão nos produtos **4**. Por sua vez, os rendimentos dos produtos **8** e **9** foram afetados pela dificuldade de separação dos diastereoisômeros por cromatografia em coluna.

Foi identificada a ocorrência do fenômeno de atropoisomerismo em 2-aril-tiazolidin-4-onas. Para os produtos da serie 4 este fenômeno extensivamente elucidado através de estudos de RMN-VT, cálculos químicos e NOESY.

Todas as moléculas tiveram suas formações confirmadas por CG-EM e RMN de  $^1\text{H}$  e  $^{13}\text{C}$ . Alguns exemplos foram caracterizados por técnicas de RMN de 2D, nesses experimentos foi possível elucidar os sinais de todos H característicos e dos H aromáticos para os produtos 4, especialmente o HMBC foi essencial para definir os sinais de H7, H9, H7" e H9". Por outro lado, pelo HMQC foi caracterizado que os sinais atípicos em 80 ppm e 52 ppm nos atropoisômeros das series 8 e 9 pertencem a C2" e C5", respectivamente.

Os estudos cristalográficos determinaram as estruturas espaciais de alguns exemplos de tiazolidinonas e de uma benzotiazepinona. Todavia, esperava-se com esta técnica definir a estereoquímica dos diastereoisômeros A e B.

Por fim, após esses estudos as moléculas estão aptas a serem submetidas aos ensaios farmacológicos de atividade de inibição da atividade da enzima AChe. É importante relatar que o LaQuiABio está obtendo bons resultados de inibição dessa enzima com alguns derivados tiazolidinônicos sintetizados pelo grupo. Todavia, as benzotiazepinonas sintetizadas nesse trabalho serão as pioneiras desse tipo de estrutura a serem avaliadas pelo grupo.

## 7. Perspectivas Futuras

Os resultados encontrados neste trabalho permitem que haja uma sequencia de estudos relacionados, dentre eles:

- A síntese de novas moléculas bioativas, especialmente amidas e benzotiazepinonas, pois o grupo LaQuiABio possui uma vasta gama de reagentes para serem precursores na síntese dessas duas classes de compostos
- É de interesse que se consiga separar os dois confôrmeros dos produtos da série **4** e obter dados de cristalografia de ambos.
- Isolar e caracterizar o intermediário amino álcool **75** para que se tenha dados experimentais de comprovação de sua formação durante a síntese das benzotiazepinonas
- Formar cristais avaliáveis de ambos os diastereoisômeros separados **8cA** e **8cB** ou **9cA** e **9cB** para então obter os dados cristalográficos de ambos os diastereoisômeros de um mesmo exemplo.
- Buscar a técnica adequada para determinar a configuração de C2 nos diastereoisômeros obtidos.

**Anexo I: Nomenclatura, propriedades físicas e dados espectrais da Parte I:  
Derivados da 5,6,7,8-THNA**

No anexo I são apresentados os nomes, rendimentos e pontos de fusão dos produtos **4** e **5** obtidos após a purificação, bem como os dados espectrais de CG-EM e de RMN de  $^1\text{H}$  e de  $^{13}\text{C}$  das substâncias inéditas sintetizadas na parte I do trabalho. Os nomes fornecidos pelo programa ChemBioDraw Ultra 13.0 foram traduzidos para o português. Os pontos de fusão foram mensurados em duplicata e os valores apresentados são a media dos mesmos. Na apresentação dos dados espectrais de RMN, para os exemplos em que há atropoisomeria uma aspa é atribuída aos sinais de menor intensidade (isômero minoritário) e por esta técnica foi estimada a proporção entre os atropoisômeros.

### A1.1 Informações sobre os produtos obtidos na parte I: Derivados da 5,6,7,8-THNA

1-(4-nitrofenil)-*N*-(5,6,7,8-tetrahidronaftalen-1-il)metanimina (**71c**), 98%.

280 ( $\text{M}^+$ , 100), 251 (60), 205 (28), 158 (23), 130 (23).

RMN  $^1\text{H}$   $\delta_{\text{H}}$  (250 MHz,  $\text{CDCl}_3$ , ppm,  $J_{\text{H-H}}$  = Hz): 8,44 (br, 1H, NH); 8,32 (d,  $J^3$  = 8,7, 2H, H5 e H5A); 8,07 (d,  $J^3$  = 8,7, 2H, H4 e H4A); 7,12 (t,  $J^3$  = 7,6, 1H, H10); 7,01 (d,  $J^3$  = 7,4, 1H); 6,76 (d,  $J^3$  = 7,2, 1H); 2,82 (br, 4H, ciclohexil); 1,82 (br, 4H, ciclohexil).

2-mercapto-*N*-(5,6,7,8-tetrahidronaftalen-1-il)acetamida (**74**), 60%.

Insolúvel em solventes compatíveis com coluna do CG-EM.

RMN  $^1\text{H}$   $\delta_{\text{H}}$  (600 MHz,  $\text{CDCl}_3$ , ppm,  $J_{\text{H-H}}$  = Hz): 9,18 (br, 1H, NH); 7,23 (d,  $J^3$  = 7,1, 1H, H4); 7,05 (d,  $J^3$  = 7,7, 1H, H3); 6,90 (d,  $J^3$  = 6,5, 1H, H7); 3,76 (br, 1H, SH); 3,33-3,25 (m, 2H, CH<sub>2</sub>); 2,85-2,49 (m, 4H, ciclohexil); 1,72 - 1,69 (m, 4H, ciclohexil).

**Anexo V: Nomenclatura, propriedades físicas e dados espectrais da Parte II:  
Derivados da *R* e *S*-1,2,3,48-THNA**

## A5.2 Informações sobre os produtos obtidos na parte II: Derivados da R ou S-1,2,3,4-THNA

No anexo V são apresentados os nomes, rendimentos e pontos de fusão dos produtos **8** e **9** obtidos após a purificação, bem como os dados espectrais de CG-EM e de RMN de  $^1\text{H}$  e de  $^{13}\text{C}$  das substâncias inéditas sintetizadas na parte II do trabalho. Os nomes fornecidos pelo programa ChemBioDraw Ultra 13.0 foram traduzidos para o português. Os pontos de fusão foram mensurados em duplicata e os valores apresentados são a media dos mesmos. Na apresentação dos dados espectrais de RMN, para os exemplos em que há atropoisomeria uma aspa é atribuída aos sinais de menor intensidade (isômero minoritário) e por esta técnica foi estimada a proporção entre os atropoisômeros.

Para alguns exemplos das séries **8** e **9** são também apresentadas as proporções por CG-EM entre os diastereoisômeros e quando possível entre os atropoisômeros, além de apresentar a mesma proporção segundo análise de RMN de  $^1\text{H}$ .

2-(4-nitrofenil)-3-*R*-(1,2,3,4-tetrahidronaftalen-1-il)tiatzolidin-4-ona (**8cA**), 50 %, p.f.: 114-115 °C.

354 ( $M^+$ , 2), 279 (1), 218 (8), 187 (73), 159 (86), 130 (100), 91 (44).
